MEMORANDUM

TO: RHCF Members

FROM: Darius Kirstein, Director of Financial Policy & Analysis

DATE: Aug. 21, 2018

SUBJECT: Summary of Patient Driven Payment Model Proposal

ROUTE TO: Administrator, CFO, Therapy Director, DON

Introduction

This memo summarizes the Patient-Driven Payment Model (PDPM) methodology that is scheduled to replace RUG-IV as the basis for nursing home Medicare Part A reimbursement starting Oct. 1, 2019. The Centers for Medicare and Medicaid Service (CMS) adopted the new methodology in the Skilled Nursing Facility (SNF) Prospective Payment System (PPS) [final rule for federal fiscal year \(FY\) 2019](#) (CMS-1696-F) published on Aug. 8, 2018. Along with finalizing PDPM, the rule establishes FFY 2019 Medicare payment rates and makes updates to the SNF Value Based Purchasing (VBP) and Quality Reporting (QR) Programs. A memo summarizing the provisions in the Final Rule that impact Medicare rates effective Oct. 1, 2018 as well as those impacting VBP and QRP, was distributed previously and is available here. It also contains a listing of the Medicare Part A rates by RUG-IV. This memo focuses exclusively on PDPM.

In the final rule, CMS addresses comments and suggestions made by stakeholders in response to the proposed rule but adopts the PDPM methodology largely as proposed with the following changes:

- For residents who had a surgical procedure during the hospitalization preceding the SNF stay, providers will select a surgical procedure category in sub-item of J2000 on the MDS to assign a resident into the appropriate PT/OT case mix category rather than code an ICD-10-PCS code in I8000 as originally proposed
- In calculating the functional score for assigning a resident into the appropriate PT/OT case mix category, missing values on section GG of the MDS will score zero points and a new response

will be added for tests of functional ability that were not performed due to environmental limitations

- For calculating the functional score when assigning a resident into the appropriate PT/OT case mix category, residents who are unable to walk will be identified through responses to MDS item GG0170I1 (walk 10 feet) instead of on the retired item GG0170H1 walking measure (does the resident walk)
- The Interim Payment Assessment (IPA) that would reclassify a resident into a different payment category mid-stay will be optional and providers may determine their own criteria for when an IPA is completed. This marks a significant simplification of the complex criteria that triggered mandatory completion of an IPA in the proposed rule. The Assessment Reference Date (ARD) of the IPA will be the date that a provider chooses to complete the IPA and payment based on the IPA will begin on the ARD.

Background

PDPM creates a new case-mix classification system as the basis for SNF Medicare Part A payments effective Oct. 1, 2019, replacing the current RUG-IV methodology. The new system bases payment not on the amount of services provided but on objective resident characteristics that are predictive of service needs. Although the PDPM model incorporates significant revisions, it is structurally similar to the RCS-1 model that CMS circulated for comment in last year's Advanced Notice of Proposed Rulemaking and reflects the same policy objectives.

The change stems from a longstanding concern within CMS that the RUG methodology over-incentivizes therapy and under-reimburses for nursing and other medical services. To address this, CMS contracted with Acumen, LLC to manage a multiyear SNF Payment Models Research (PMR) Project to explore alternative payment methodologies. Much of the work of the project involved identifying patient characteristics that drive costs, dividing these into major categories, and finding appropriate gradations to align reimbursement to cost. The model was then calibrated for budget neutrality.

As a result of this work, CMS and Acumen initially developed an alternative to the RUG-IV classification system, which they named the Resident Classification System, Version I (RCS-I). In the spring of 2017, CMS published an Advanced Notice of Proposed Rulemaking that outlined the methodology and requested stakeholder feedback. CMS used that feedback to refine the RCS-1 methodology, reducing the number of possible payment categories, revising how a resident's functional score would be calculated, separating PT and OT into separate components, and making other changes. CMS renamed this revised methodology the Patient-Driven Payment Model (PDPM), but it retained a similar overall structure and maintained the same philosophical underpinnings as RCS-1. The technical reports that describe the analyses used to inform the development of the new system are available on the SNF PPS Payment Models Research page [here](#).

In the SNF PPS proposed rule for FFY 2019, CMS outlined the PDPM methodology and requested that stakeholders provide additional feedback. While CMS reviewed and commented on the feedback, ultimately, the version of PDPM published in the final rule is very similar to that published in the proposed rule. It is possible that CMS may make some tweaks to PDPM in next year's rulemaking process in advance of Oct. 1, 2019 implementation.

PDPM Overview

Structurally, the PDPM:

- Separates the amount of therapy from payment by no longer relying on minutes of therapy provided to a resident to classify that resident into a payment category;
- Imposes a combined 25 percent limit on group and concurrent therapy, by discipline, to ensure that at least 75 percent of therapy is provided on an individual basis;
- Establishes five individual components, each with its own discrete case-mix adjustment, and classifies each resident into the appropriate category for each of the components (Physical Therapy (PT), Occupational Therapy (OT), Speech/Language Pathology (SLP), nursing, and non-therapy ancillaries (NTA)) based primarily on that resident's clinical and functional characteristics;
- Incorporates a variable, per-diem payment adjustment for the PT, OT, and NTA components, which results in a decreasing daily payment as a resident's stay progresses; and
- Reduces required PPS assessments to the 5-Day Scheduled PPS Assessment, PPS Discharge Assessment with some additional items, and a new, optional Interim Payment Assessment (IPA) that can be used to change the resident classifications assigned by the 5-Day PPS Assessment.

Specifically, instead of a resident being assessed into a RUG-IV category that determines the per-day payment under the current methodology, payment under the PDPM model will be the sum of five separate, case-mix adjusted components plus a non-case-mix component. For each component CMS will established a base rate. Each base rate will be adjusted by the component-specific case mix derived from resident characteristics deemed relevant to that component.

Figure 1

PT	OT	SLP	Nursing	NTA	Non-Case Mix
<ul style="list-style-type: none"> - Primary reason for SNF care - Functional status 	<ul style="list-style-type: none"> - Primary reason for SNF care - Functional status 	<ul style="list-style-type: none"> - Primary reason for SNF care - Cognitive status - Presence of swallowing disorder or mechanically altered diet - Other SLP-related comorbidities 	<ul style="list-style-type: none"> - Clinical information from SNF stay - Functional status - Extensive services received - Presence of depression - Restorative nursing services received 	<ul style="list-style-type: none"> - Co-morbidities present - Extensive services received 	<ul style="list-style-type: none"> - Room and board - Capital-related costs - Admin costs
<ul style="list-style-type: none"> - Point in the stay (variable per diem adjustment) 	<ul style="list-style-type: none"> - Point in the stay (variable per diem adjustment) 			<ul style="list-style-type: none"> - Point in the stay (variable per diem adjustment) 	

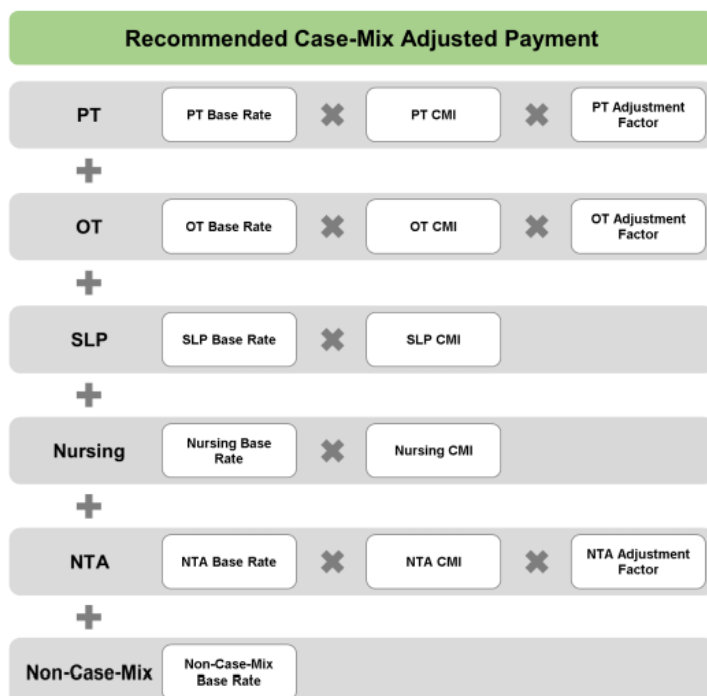

The five components, also shown in Figure 1 above with their associated payment drivers, are:

- A PT base rate adjusted by one of 16 PT case mix weights (based on clinical category and functional score) to yield a PT component;
- An OT base rate adjusted by one of 16 OT case mix weights (based on the same 16 categories and resident characteristics as PT but with an OT specific case mix) to yield an OT component;
- A Speech/Language Pathology (SLP) base rate adjusted by one of 12 SLP case mix weights (based on the presence of an acute neurological condition, and/or a SLP-related comorbidity and/or cognitive impairment as well as whether the resident requires a mechanically altered diet and/or has a swallowing disorder) to yield an SLP component;
- A Nursing base rate adjusted by one of 25 nursing case mix weights (i.e., the current 43 non-rehab RUGs consolidated into 25 categories) to yield a nursing component;
- A Non-Therapy Ancillary (NTA) base rate adjusted by one of six NTA case mix weights (based on the presence of specific conditions and need for extensive services) to yield an NTA component; and,
- A non-case-mix component meant to reimburse for room and board, administrative and capital costs, that would remain as it currently is in the new methodology.

The rate is the sum of these six components subject to two additional adjustments. The PDPM model incorporates an adjustment to the PT, OT and NTA components to reflect CMS findings that costs for these two components are higher at the beginning of a Part A stay and decrease as the stay progresses. This is discussed in greater detail further in the memo.

Additionally, the resulting rate will be wage-adjusted using the same hospital wage index and the same wage adjustment methodology as is currently used. The existing market basket methodology currently used to update base rates for inflation, including the forecast error and multifactor productivity adjustments, will also be maintained. Figure 2 provides a visual representation of the proposed PDPM methodology.

Figure 2

Payment Models Research (PMR) Discussions and Materials

The proposal to replace RUG-IV as the case mix adjustment model has its origin in a payment models research project CMS embarked on in 2013. That year CMS contracted with Acumen, LLC, a firm specializing in policy research and analytics, to manage the Skilled Nursing Facility Payment Models Research (SNF PMR) Project. The SNF PMR was comprised of several phases. The first phase reviewed past research studies and policy issues related to SNF Prospective Payment System (PPS) therapy payment and examined options for improving or replacing the current system of paying for SNF therapy services.

The second phase expanded the scope of the project beyond therapy to include other aspects of SNF PPS. This phase included four meetings of Technical Expert Panels (TEPs) comprised of industry experts, stakeholders, clinicians as well as the Acumen and CMS research team. It was during this phase that the outlines of a new methodology were developed and preliminary impacts were modeled.

In the third phase, Acumen developed supporting language and documentation as well as a technical report on the initial (RCS-1) alternative methodology. The final phase of the project which began in October 2017, was focused on refining and updating the model using newer data and taking into account stakeholder feedback received in response to the Advance Notice of Proposed Rulemaking that unveiled the RCS-1 methodology. The result was the PDPM methodology that CMS finalized in this year's SNF PPS Rule for implementation in Oct. 2019. Acumen also developed various tools, including a model grouper, to allow a better understanding of how RUG-IV based payments would correspond with PDPM payments.

The 2014 report on alternative model research as well as presentations and discussion summaries from each of the four Technical Expert Panel discussions are available on the CMS SNF PPS Payment Model Research page [here](#). The page also has links to download various other PDPM resources including a classification walkthrough, a grouper tool and the provider specific impact estimates (discussed below). Please verify that you have selected the most recent version of the document or tool when downloading. The Technical Report released in April of 2018 that focuses on the PDPM model and describes the underlying data analyses is [here](#).

Notably, CMS is interested in implementing a model within the current statutory requirements, meaning that the requisite changes could be made administratively without requiring a change in federal law. This includes maintaining budget neutrality when moving from one methodology to the other. Tables and information in this memo are as published in the proposed and final rules as well as in the supporting Technical Report.

The PDPM Model

Under the RUG-IV case-mix model, a resident is first categorized as either a rehabilitation resident or a non-rehabilitation resident, and then categorized further based on additional aspects of the resident's care. Under the PDPM case-mix model, the primary focus is on categorizing the resident based on the clinical reasons for the resident's SNF stay.

The PDPM was developed to be a model where payments derive almost exclusively from resident characteristics. More specifically, the model separately identifies and adjusts five separate case-mix

components to best fit a resident's characteristics and predicted care needs, and then combines these together with the non-case-mix component to form the full SNF PPS per diem rate for that resident. Key in the development of the model were the results of a number of regression analyses that allowed researchers to associate variations in costs to specific resident characteristics, and combinations of characteristics, that were consistent and predictive of staff time and the associated costs. Statistical modeling also allowed researchers to assign appropriate case mix weight for each grouping. Each of the five case-mix adjusted components relies on a set of different characteristics to assign the resident to a component-specific case mix group (with the exception of OT and PT which rely on the same characteristics but assign different weights to them).

Figure 3 below shows the 2019 FY Urban and Rural base rates, by component, for RUG-IV and PDPM showing how the base rates associated with RUG-IV components were divided among the PDPM components. The tables present RUG-IV base rates for 2019 and estimated base rates for PDPM for the same time period. Each PDPM component is discussed individually below.

Figure 3

FY 2019 RUG-IV Base Rates

Rate Type	Nursing Case-Mix	Therapy Case-Mix	Therapy Non-Case Mix	Non-Case Mix
Urban	\$ 181.44	\$ 136.67	\$ 18.00	\$ 92.60
Rural	\$ 173.34	\$ 157.60	\$ 19.23	\$ 94.31

FY 2019 PDPM Base Rates

Rate Type	Nursing Case-Mix	NTA Case-Mix	PT Case-Mix	OT Case-Mix	SLP Case-Mix	Non-Case-Mix
Urban	\$ 103.46	\$ 78.05	\$ 59.33	\$ 55.23	\$ 22.15	\$ 92.63
Rural	\$ 98.83	\$ 74.56	\$ 67.63	\$ 62.11	\$ 27.90	\$ 94.34

Components 1 and 2: Physical & Occupational Therapy (PT/OT)

While research indicated that resident characteristics that predicted Speech and Language Pathology (SLP) costs differed significantly from those predictive of PT and OT costs, there was a strong correlation between the cost predictors for PT and OT. Because of this, CMS decided to maintain the same case-mix classification model for both components in the PDPM model. In practice, this means that the same resident characteristics will determine into which of the 16 PT/OT categories a resident is classified. However, each of the 16 categories has a separate PT and OT weight that is applied to separate PT and OT base rates. CMS believes that providing separate case-mix-adjusted payments for PT and OT may allay concerns about inappropriate substitution across disciplines and encourage provision of these services according to clinical need.

To separate the RUG-IV therapy base rate into three component (i.e., separate OT, PT and SLP components), researchers used 1995 cost reports to calculate estimated proportions of per-day therapy costs that PT, OT and SLP represented. For urban areas, they calculated the proportion of PT to be 43.4

percent, OT to be 40.4 percent and SLP to be 16.2 percent of the combined therapy base rate. For rural areas the percentage were 42.9 percent, 39.4 percent and 17.7 percent, respectively.

Once they had calculated the base rates for the components, researchers analyzed predictors of PT and OT costs. They determined that the three most relevant predictors of these costs were the clinical reasons for the SNF stay, the resident's functional status, and the presence of a cognitive impairment.

Researchers found ten clinical categories to be most predictive of resource utilization in SNFs and encompassed the bulk of SNF residents. They collapsed these into four clinical categories which were predictive of PT/OT costs and used them as a first step in assigning a resident into a PT/OT case mix group. The four clinical categories (with their component sub-categories shown in parentheses) are:

1. Major Joint Replacement or Spinal Surgery
2. Other Orthopedic (includes non-Surgical Orthopedic/Musculoskeletal and Orthopedic Surgery other than #1 above)
3. Non-Orthopedic Surgery and Acute Neurologic
4. Medical Management (includes Acute Infections, Cancer, Pulmonary, Cardiovascular & Coagulations)

A resident will be classified into a clinical category using item I8000 of the MDS which reports the ICD-10-CM code representing the primary reason for the resident's SNF stay. Additionally, for any resident who received a surgical procedure during their hospital stay, the provider will select a surgical procedure category in a sub-item of item J2000. A file mapping ICD-10 Codes to the PDPM clinical categories can be downloaded [here](#).

Because analysis indicated that a resident's functional status was predictive of PT and OT costs, researchers incorporated an Activity of Daily Living (ADL) score as the second characteristic used to assign a resident into a PT/OT case mix group. While RUG-IV uses late loss ADLs coded in section G of the MDS, the PDPM will rely on section GG items that were found to be predictive of PT and OT costs: four late loss ADLs (bed mobility, transfer, eating, toileting) and two early loss ADLs (oral hygiene and walking). Those conversant with RCS-1 will note that this approach to ADL scoring is a significant change from the prior proposal, as is the CMS proposal to remove a separate measure of cognitive function as a predictor of PT and OT costs.

Figure 4

	Response	ADL Score
05, 06	Set-up assistance, Independent	4
4	Supervision or touching assistance	3
3	Partial/moderate assistance	2
2	Substantial/maximal assistance	1
01, 07, 09, 88	Dependent, Refused, N/A, Not Attempted, Resident cannot walk*	0

**based on response to item GG0170H1*

Figure 4 shows the values associated with responses on ADL items on the MDS while Figure 5 shows which ADL items on section G of the MDS would be included in the calculation of the score. Note that residents with higher level of independence will have higher ADL scores resulting in higher PT/OT

reimbursement component. To avoid overlap and the potential for double-counting of the mobility items, CMS proposes to average the responses for those items as indicated in the table below. The sum of the scores from Figure 4 will yield a score between 0 and 24 points for the resident. The ADL ranges that separate payment categories are scores totaling 0-5, 6-9, 10-23 and 24.

Figure 5

Section GG Item		ADL Score
GG0130A1	Self-care: Eating	0-4
GG0130B1	Self-care: Oral Hygiene	0-4
GG0130C1	Self-care: Toileting Hygiene	0-4
GG0170B1	Mobility: Sit to lying	0-4 (average of 2 items).
GG0170C1	Mobility: Lying to sitting on side of bed	
GG0170D1	Mobility: Sit to stand	0-4 (average of 3 items).
GG0170E1	Mobility: Chair/bed-to-chair transfer	
GG0170F1	Mobility: Toilet transfer	
GG0170J1	Mobility: Walk 50 feet with 2 turns	0-4 (average of 2 items).
GG0170K1	Mobility: Walk 150 feet	

Once a resident is categorized into an appropriate clinical category and assigned an ADL-based functional score, the characteristics are combined to categorize them into one of the 16 PT/OT case mix groups. The PT/OT case mix groups along with their discrete PT and OT case mix weights and resident characteristics used in assigning a resident to one of the groups is shown in Figure 6. The PT base rate is multiplied by the PT case mix index associated with the case mix group into which the resident is assigned. The same is done with OT. The two case mix adjusted base rates are summed to yield the PT/OT portion of the rate.

Figure 6

Clinical category	Section GG function score	PT OT case-mix group	PT case-mix index	OT case-mix index
Major Joint Replacement or Spinal Surgery	0-5	TA	1.53	1.49
	6-9	TB	1.69	1.63
	10-23	TC	1.88	1.68
	24	TD	1.92	1.53
Other Orthopedic	0-5	TE	1.42	1.41
	6-9	TF	1.61	1.59
	10-23	TG	1.67	1.64
	24	TH	1.16	1.15
Medical Management	0-5	TI	1.13	1.17

	6-9	TJ	1.42	1.44
	10-23	TK	1.52	1.54
	24	TL	1.09	1.11
Non-Orthopedic Surgery and Acute Neurologic	0-5	TM	1.27	1.3
	6-9	TN	1.48	1.49
	10-23	TO	1.55	1.55
	24	TP	1.08	1.09

Rate Calculation Example: a resident in an urban area who is classified into the major joint replacement category and requires partial assistance in all measured ADLs which results in an ADL score of 12, would be assessed into the “TC” PT/OT case mix group. This group has a PT case mix index of 1.88 and an OT index of 1.68. The PT base of \$59.33 (for urban areas) is multiplied by 1.88 to yield \$111.54 and is added to the OT component of \$92.79 (base rate of \$55.23 multiplied by 1.68) for a total PT/OT component of \$204.33.

Component 3: Speech/Language Pathology (SLP)

The characteristics found to be most relevant in predicting relative differences in Speech/Language Pathology costs were clinical reasons for the SNF stay; presence of a swallowing disorder or the need for a mechanically altered diet; and the presence of an SLP-related comorbidity or cognitive impairment.

The clinical category found to correlate to SLP costs was “acute neurologic”, so the first step in assigning a SLP case mix group is to determine whether the resident has an acute neurologic condition or not. The second step is determining whether the resident has a SLP-related comorbidity found to be relevant in predicting resident SLP costs. The 12 SLP-related comorbidities are shown in Figure 7 below. The third step is determining if a resident had a mild to severe cognitive impairment (defined as a BIMS score of 12 or lower and/or a CPS score above 0). Determining if none, one, two or all three of these conditions apply (acute neurological condition, cognitive impairment and/or a SLP-related comorbidity) is the first determinant in assigning a SLP case mix group.

Figure 7

Aphasia	Laryngeal cancer
CVA, TIA, or Stroke	Apraxia
Hemiplegia or Hemiparesis	Dysphagia
Traumatic Brain Injury	ALS
Tracheostomy Care (While a Resident)	Oral Cancers
Ventilator or Respirator (While a Resident)	Speech and Language Deficits

The other drivers of SLP costs, and therefore characteristics selected to determine a resident’s SLP case mix group, was presence of a swallowing disorder and/or the need for a mechanically altered diet. Determining whether neither, either or both are present would be the final step in selecting which of

the 12 SLP case mix categories is appropriate for the resident. Figure 8 lists the SLP-related case mix index groups.

Figure 8

Presence of acute neurologic condition, SLP-related comorbidity, or cognitive impairment	Mechanically altered diet or swallowing disorder	SLP case-mix group	SLP case-mix index
None	Neither	SA	0.68
None	Either	SB	1.82
None	Both	SC	2.66
Any one	Neither	SD	1.46
Any one	Either	SE	2.33
Any one	Both	SF	2.97
Any two	Neither	SG	2.04
Any two	Either	SH	2.85
Any two	Both	SI	3.51
All three	Neither	SJ	2.98
All three	Either	SK	3.69
All three	Both	SL	4.19

Rate Calculation Example: A resident assessed with a non-neurologic condition who has a mild cognitive impairment and an SLP-related co-morbidity (i.e., meets the condition of “any two” in the first column), who does not have a swallowing disorder nor requires a mechanically altered diet (i.e., meets the condition of “neither” in column 2) would be assessed into the “SG” SLP case mix group. This group has a case mix index of 2.04. The SLP base of \$22.15 (2019 base estimate for urban areas) is multiplied by 2.04 to yield \$45.19 which is the SLP component of the rate.

Component 3: Nursing

The PDPM methodology separates the nursing component used in the RUG-IV methodology into a nursing component and a non-therapy ancillary (NTA) component, each of which is subject to separate case mix adjustment. The original 1995 base rate calculations indicated the percentages attributable to nursing and NTA making it possible for CMS to separate the current nursing component into two parts. For urban areas, nursing (which also includes social services) represents 56.6 percent of the current nursing component base costs. The proportion is 57.3 percent for rural areas. The remainder is attributed to the NTA component.

PDPM consolidates the 43 non-rehabilitation categories in the current RUG-IV methodology into 25 PDPM nursing categories by decreasing distinctions based on function and bases the nursing component ADL scoring on selected items reported in section GG of the MDS. Case mix weights are revised with updated wage data and weight development data was updated to subsume the entire STRIVE population, including those residents that were classified into rehabilitation categories (whose data was not used when the current RUG-IV nursing case mix weights were developed). Adjustments were made

to correct for STRIVE oversampling and a 18 percent increase in the nursing component is provided for residents with HIV/AIDS.

Figure 9

MDS Code	MDS Response	ADL Score
05, 06	Set-up assistance, Independent	4
4	Supervision or touching assistance	3
3	Partial/moderate assistance	2
2	Substantial/maximal assistance	1
01, 07, 09, 88	Dependent, Refused, N/A, Not Attempted	0

Figure 10

Section GG Item		ADL Score
GG0130A1	Self-care: Eating	0-4
GG0130C1	Self-care: Toileting Hygiene	0-4
GG0170B1	Mobility: Sit to lying	0-4 (average of 2 items).
GG0170C1	Mobility: Lying to sitting on side of bed	
GG0170D1	Mobility: Sit to stand	0-4 (average of 3 items).
GG0170E1	Mobility: Chair/bed-to-chair transfer	
GG0170F1	Mobility: Toilet transfer	

While similar to the ADL scoring in the PT/OT components, the nursing component uses fewer ADL items. Figure 9 shows the values associated with each ADL response while Figure 10 shows the items that will be used in the nursing component. Note that as with the PT and OT components, residents with higher level of independence will have higher ADL scores. To avoid overlap and the potential for double-counting of the mobility items, the scores corresponding to responses for those items will be averaged as indicated in Figure 9. The sum of the ADL scores from Figure 9 will yield a score between 0 and 16 points for the resident. The ADL ranges that mark distinct payment categories for nursing are 0-5, 6-14, 15-16 (and 11-16 for behavioral categories).

Figure 11 shows how the current RUG-IV nursing categories crosswalk into the 25 categories of PDPM, indicate the resident characteristics associated with each category, and provide the case mix index for each case mix group.

Figure 11

RUG-IV nursing RUG	Extensive services	Clinical conditions	Dpressn	Number of restorative nursing services	GG-based function score	PDPM nursing case-mix group	Nursing case-mix index
ES3	Trach & Vent				0-14	ES3	4.04
ES2	Trach or Vent				0-14	ES2	3.06
ES1	Infection				0-14	ES1	2.91
HE2/HD2		Serious medical conditions e.g. comatose, septicemia, respiratory therapy	Yes		0-5	HDE2	2.39
HE1/HD1			No		0-5	HDE1	1.99
HC2/HB2			Yes		6-14	HBC2	2.23
HC1/HB1			No		6-14	HBC1	1.85
LE2/LD2		Serious medical conditions e.g. radiation therapy or dialysis	Yes		0-5	LDE2	2.07
LE1/LD1			No		0-5	LDE1	1.72
LC2/LB2			Yes		6-14	LBC2	1.71
LC1/LB1			No		6-14	LBC1	1.43
CE2/CD2		Conditions requiring complex medical care e.g. pneumonia, surgical wounds, burns	Yes		0-5	CDE2	1.86
CE1/CD1			No		0-5	CDE1	1.62
CC2/CB2			Yes		6-14	CBC2	1.54
CA2			Yes		15-16	CA2	1.08
CC1/CB1			No		6-14	CBC1	1.34
CA1			No		15-16	CA1	0.94
BB2/BA2		Behavioral or cognitive symptoms		2 or more	11-16	BAB2	1.04
BB1/BA1				0-1	11-16	BAB1	0.99
PE2/PD2		Assistance with daily living and general supervision		2 or more	0-5	PDE2	1.57
PE1/PD1				0-1	0-5	PDE1	1.47
PC2/PB2				2 or more	6-14	PBC2	1.21
PA2				2 or more	15-16	PA2	0.7
PC1/PB1				0-1	6-14	PBC1	1.13
PA1				0-1	15-16	PA1	0.66

Rate Calculation Example: A resident meeting the CC1 Clinically Complex nursing RUG group criteria based on current RUG assignment rules would be assessed into the CBC1 nursing case mix group. The group has a case mix index of 1.34. The nursing base of \$103.46 (for urban areas) is multiplied by 1.34 to yield \$138.64 which represents the nursing component of the rate.

Component 4: Non-Therapy Ancillary (NTA)

In the PDPM model, Non-Therapy Ancillary (NTA) costs such as drugs, laboratory services, respiratory therapy and medical supplies are no longer included in the nursing component as they are in the current methodology, but are rather split out as a separate component with a separate and distinct case mix adjustment based on resident characteristics. Data analysis indicated that certain comorbidity conditions and extensive services were highly predictive of differences in NTA costs. Several of those conditions and characteristics were discarded due to coding reliability concerns as well as CMS wariness about creating perverse incentives.

The 50 selected extensive services and conditions predictive of costs, listed in Figure 12, were each assigned a point value. The points corresponding to each condition present, or extensive service required, are summed for a total point score. In this way the NTA component more adequately reflects relative differences in NTA costs of each condition or service, as well as the additive effect of multiple comorbidities.

Figure 12

Condition/extensive service	Source	Points
HIV/AIDS	SNF Claim	8
Parenteral IV Feeding: Level High	MDS Item K0510A2, K0710A2	7
Special Treatments/Programs: Intravenous Medication Post-admit Code	MDS Item O0100H2	5
Special Treatments/Programs: Ventilator or Respirator Post-admit Code	MDS Item O0100F2	4
Parenteral IV feeding: Level Low	MDS Item K0510A2, K0710A2, K0710B2	3

The model uses six NTA groupings, each representing a point score range and each with a distinct CMI weight. Residents are categorized into an NTA case mix group based on their total NTA point score and their payment includes the NTA base rate adjusted by the category case mix weight. The resulting NTA Case Mix Classification Groups along with their case mix weights is shown in Figure 13.

Figure 13

NTA score range	NTA case-mix group	NTA case-mix index
12+	NA	3.25
9-11	NB	2.53
6-8	NC	1.85
3-5	ND	1.34
1-2	NE	0.96
0	NF	0.72

Rate Calculation Example: A resident with Diabetes with an opportunistic infection and cirrhosis would have a total point score of 5. This would place them in the “ND” NTA case mix group. The group has a case mix index of 1.34. The NTA base rate of \$78.05 (for urban areas) is multiplied by 1.34 to yield \$104.59 which represents the NTA component of the rate.

Variable Per-Diem Adjustment

For each RUG category, the current RUG-IV methodology provides the same level of reimbursement for every day of a qualified Part A stay (assuming the resident’s RUG category remains unchanged). To

address the concern that resource need may be greater at the beginning of the stay and decline as the stay progresses, PDPM incorporates adjustments for certain rate components that result in higher rates at the beginning days of a stay and decline as the stay progresses.

Data analysis suggests that PT, OT and NTA costs are greatest at the beginning of a stay. Because the decline differs for PT/OT and NTA costs, CMS developed two separate decreasing adjustment schedules that will be applied to the PT/OT component and the NTA component to reflect this. Analysis suggests that SLP costs do not vary as a SNF stay progresses and there is insufficient data to gauge these differences for the nursing component, meaning that only the PT/OT and NTA components are subject to this variable per-diem adjustment.

Analysis suggests that PT and OT costs remain relatively high for the first 20 days of a stay and then decline by approximately 0.3 percent per day. Consequently, the PDPM methodology adjusts PT and OT component reimbursement so that after the initial 20 days they decline by two percent every seven days.

Research on NTA costs indicate that these costs are very high at the start of a SNF stay, drop quickly after the first three days, and then remain relatively stable throughout the remainder of the stay. To reflect this, CMS set the NTA component to 300 percent (i.e, three times the appropriate NTA component amount) for the first three days, then to 100 percent for the remainder of the stay. Figures 14 and 15 below show the adjustment factors that are used for PT/OT and NTA.

CMS also deliberated on how to address interrupted stays for purposes of resetting the variable per-day adjustment back to day one. To avoid creating an incentive for discharge and readmission, CMS decided that in cases where a resident is discharged but returns to the same SNF no later than 12 a.m. at the end of the third day, the resident will be assigned the same classification as prior to discharged and the stay would be considered a continuation of the previous stay for variable per-diem adjustment purposes. If the readmission occurs later than the three day window or if the resident is readmitted to a different SNF (no matter how long the interruption), the variable adjustments is reset to day one.

Figure 14: PT/OT Variable Per-Diem Adjustment Factors

Medicare payment days	Adjustment factor
1-20	1.00
21-27	0.98
28-34	0.96
35-41	0.94
42-48	0.92
49-55	0.90
56-62	0.88
63-69	0.86
70-76	0.84
77-83	0.82
84-90	0.80
91-97	0.78
98-100	0.76

Figure 15: NTA Variable Per-Diem Adjustment Factors

Medicare payment days	Adjustment factor
1-3	3
4-100	1

Rate Calculation Example: The table below provides an example of how the variable per-diem adjustment factors would be applied in calculating the rate for the first day vs. the 60th day of a resident's stay. Note that only the PT/OT and NTA components are subject to these adjustments and that while the PT/OT adjustment continues to decline during the entire stay, the NTA adjustment impacts only the first three days of the stay.

As Figure 16 suggests, the total Medicare Part A rate under the PDPM methodology is calculated by summing each of the five case-mix adjusted components. The PT, OT and NTA components are further adjusted by their respective variable per-diem adjustment factors. The non-case mix component is added to this and the wage-related portion of the rate will be wage-adjusted using the same wage index as is currently used in RUG-IV.

Figure 16: Sample Rate with Per-Diem Adjustment Factors (using 2019 base rates)

Component	Case-Mix Adjusted Rate (before variable adjustment)	Day 1		Day 60	
		Day 1 Variable Adjustment	Day 1 Rate (with variable adjustment)	Day 60 Variable Adjustment	Day 60 Rate (with variable adjustment)
PT	\$ 111.54	1.0	\$ 111.54	0.88	\$ 98.16
OT	\$ 92.79	1.0	\$ 92.79	0.88	\$ 92.79
SLP	\$ 45.19	na	\$ 45.19	na	\$ 45.19
Nursing	\$ 138.64	na	\$ 138.64	na	\$ 138.64
NTA	\$ 104.59	3.0	\$ 313.77	1.0	\$ 104.59
Non-Case Mix	\$ 92.63	na	\$ 92.63	na	\$ 92.63
TOTAL	\$ 585.38		\$ 794.56		\$ 572.00

Less Frequent PPS Assessments

CMS notes that the MDS assessments required under the current SNF PPS are largely driven by the therapy that a resident receives. The case-mix classification under the PDPM model relies to a much lesser extent on characteristics that may change over the course of a resident's stay. Instead, it relies on more stable predictors of resource utilization by tying case-mix classification to resident characteristics such as diagnosis information and comorbidities.

Given the greater reliance of the proposed case-mix classification on resident characteristics that are relatively stable over a resident's SNF stay, CMS is proposing to reduce the number of MDS assessments that providers are required to complete. Specifically, CMS is proposing to use the 5-day SNF PPS

scheduled assessment to classify a resident under the PDPM model for the entirety of a resident's Part A SNF stay, with an optional Interim Payment Assessment (IPA) (similar to the current significant change assessment) available for use at the provider's discretion, and a required Discharge Assessment as the only other assessments.

The IPA would be used to reclassify a resident from the initial classification determined by the 5-day assessment. In the proposed rule CMS envisioned it as a requirement when there was a change in the resident's first tier classification criteria (for any component) that resulted in a payment change AND that the change is such that the resident is not expected to return to their original clinical status within 14 days. In the final rule, CMS accepts stakeholder suggestions to simplify the IPA and deems it to be an optional assessment allowing providers to determine their own criteria for when an IPA is completed. As a result, proposed payment penalties related to a provider's failure to meet IPA requirements no longer apply. The Assessment Reference Date (ARD) of the IPA will be the date that a provider chooses to complete the IPA and payment changes based on the IPA will begin on the ARD. Figure 17 summarizes the PDPM PPS assessments. CMS notes that none of these changes to PPS assessments change any requirements that derive from the Omnibus Budget Reconciliation Act of 1987 (OBRA 87), which establishes requirements for all nursing home resident assessments, regardless of payer.

Figure 17

Medicare MDS assessment schedule type	Assessment reference date	Applicable standard Medicare payment days
5-day Scheduled PPS Assessment	Days 1-8	All covered Part A days until Part A discharge (unless an IPA is completed).
Interim Payment Assessment (IPA)	The date the facility chooses to complete the assessment relative to the triggering event for the IPA	ARD of the assessment through Part A discharge (unless another IPA assessment is completed).
PPS Discharge Assessment	PPS Discharge: Equal to the End Date of the Most Recent Medicare Stay (A2400C) or End Date	N/A.

In light of the reduction in the frequency of assessments that would be required under PDPM and to better track therapy utilization under the new methodology, CMS will add 18 items to the SNF PPS Discharge Assessment. These are identified in Figure 18 below.

Concurrent and Group Therapy

CMS is concerned about the incentive for group and concurrent therapy that may derive from a PDPM methodology that no longer relies on minutes of therapy provided to classify the resident for payment purposes. The agency believes that individualized therapy which is tailored to address each beneficiary's specific care needs is generally the most appropriate mode of therapy for SNF residents. To address this, PDPM establishes a combined 25 percent limit on concurrent and group therapy for each discipline of therapy provided.

Impact Modeling

Using estimated 2017 PDPM base rates (calibrated to be budget neutral), CMS recategorized residents based on MDS data into PDPM payment categories and compared how these PDPM payments compared to actual 2017 RUG-IV payments. Appendixes A show the resident-level payment impact based on specific resident characteristics. Appendix B shows the facility-level payment impact based on facility characteristics. Note that the comparisons assume no behavior changes on the part of providers.

As would be expected based on the CMS concerns that precipitated these changes, the most pronounced decrease on the resident level (8.4 percent) is for those in the ultra-high (i.e., RU) therapy RUG categories which represented 58.4 percent of all Medicare fee for service SNF stays in 2017. Modeling suggested that reimbursement for residents in other rehabilitation groups would increase: by 11 percent for those in the very high (i.e., RV) categories which represented 22.4 percent of 2017 stays and by 27 percent for the high (i.e., RH) categories which represented 6.8 percent of stays. Modeling of payment changes for non-rehab stays which accounted for 9.1 percent of stays increased by 50.5 percent.

Modeling suggested that under the new payment system, reimbursement for bariatric residents, those with severe cognitive impairments and stays that are 15 days or shorter would see noticeable increases, while residents with HIV/AIDS, those receiving therapy from multiple disciplines and those with stays longer than 31 days would see the largest decreases.

On the facility level, modeling showed non-profit homes, that represent 22.6 percent of providers nationwide, seeing an overall 2 percent increase, while payments to for-profit homes decreased by 0.7 percent. Payments to government sponsored homes increased by 4.2 percent. However, the change drivers were clearly therapy: payments to homes where Ultra-High therapy RUGs represented 90 percent or more of Part A FFS days decreased by 9.8 percent; payments dropped by 6 percent to homes billing 75-90 percent of their days as Ultra-High; homes where Ultra-High therapy days accounted for 50 to 75 percent of total days saw a 0.4 percent revenue drop. Revenue for homes that billed 50 percent or fewer of their days as Ultra-High increased.

CMS also made available facility specific impact estimates showing the difference between actual Part A payments based on the distribution of resident days by RUG-IV groups in 2017 and estimated payments based on categorizing the 2017 days into PDPM payment categories. The file also breaks out the estimated change in payment for therapy and nursing components. The CMS file can be downloaded [here](#) and a file showing just New York homes is [here](#). Please note that there are no estimates for roughly 100 New York homes.

Based on the CMS/Acumen analysis (and assuming the same Medicare residents with the same lengths of stay and receiving the same services for each nursing home as in 2017), 52% of homes in NY would see a total revenue decrease while 48% would see a revenue increase if reimbursement for these same residents were provided using the new payment model. The statewide aggregate funding decrease for NY would be \$87.9M based on the 506 homes with estimates.

When it comes to not-for-profit homes, 39 percent would do worse while 61 percent would do better. However, the statewide estimated aggregate change for voluntary homes is an \$8.7M decrease and there are some voluntary homes with significant drop including 6 whose estimated decrease exceeds 10%.

The bulk of the estimated decreases are driven by the change in reimbursement for residents who are in the current ultra-high RUG categories, that is, for the residents who receive the highest number of therapy minutes. Other components, especially nursing and non-therapy ancillaries, are being valued more. CMS is attempting to change what they see as a perverse incentive in the current methodology to provide more therapy than may be required and point to the fact that in so many cases therapy is

provided to the RUG category threshold as an indicator that reimbursement, not need, may determine therapy utilization in some cases.

It is important to keep in mind that if the same level of therapy is provided to residents under the new methodology, the revenue reductions may play out as estimated. But if providers respond by finding opportunities to provide therapy more efficiently, for example by relying more on group and/or concurrent therapy (capped at 25%), the decrease in reimbursement for these high-therapy individuals may be accompanied by a decrease in provider costs. Those homes that serve large proportions of non-therapy residents are likely to see costs of care better reflected in the PDPM payment structure.

However, what is not reflected in the modeling are the costs of implementing a new system: staff training and education costs, software updates, policy and procedure changes, vendor contract revisions, etc.. While these costs are substantial and argue for additional funding in the new methodology, at least initially, instead of for budget neutrality, violating budget neutrality would require Congressional approval, something CMS is trying to avoid.

Conclusion

The PDPM model represents a significant change in how Medicare reimburses nursing homes for post-acute care. It relies much less on therapy which is the largest reimbursement driver in the current methodology and places more weight on nursing services and other clinical needs and characteristics of the resident. The methodology for calculating the rate is more complex and Part A revenue is likely to be less predictable going forward. Payments will decrease as a resident's stay progresses. More aspects of a resident's unique characteristics and needs will factor into determining the resident's payment classification, which CMS argues will make for more resident centered care and reimbursement. Because the PDPM methodology is based on specific resident characteristics predictive of resource utilization for each component, CMS believes that payments will be better aligned with resident service needs.

Members should become familiar with the incentives and reimbursement drivers in PDPM to better gauge the impact the changes may have on their Medicare reimbursement. LeadingAge and LeadingAge New York will be offering various educational opportunities to help member become acquainted with PDPM and the tools that CMS is making available. Providers should review their clinical staff capabilities and evaluate them in light of the coding expertise that will be required to ensure accurate Medicare Part A payment from the beginning of a resident's stay. Members should also assess the implications of the new methodology on how they organize and provide therapy services.

LeadingAge NY will post PDPM information and resources on the association's nursing home web page under a dedicated PDPM section. Please contact Darius Kirstein, dkirstein@leadingageny.org, 518-867-8841, or Dan Heim, dheim@leadingageny.org, 518-867-8383, with questions.
